

This listing of claims will replace all prior versions, and listings, of claims in the application:

The Status of the Claims:

1-30. (Canceled).

31. (Currently amended) A door for at least partially covering a doorway and movable relative thereto, the doorway being defined by a surrounding structure that includes a wall and a floor such that the doorway has a width, wherein the door is ~~movable relative to the surrounding structure~~, the door comprising:

an upper track;

a door panel suspended from the upper track and being movable horizontally across the doorway along a predetermined normal path;

a lower track disposed below the upper track ~~and above the floor~~, wherein the lower track is attachable to one of the door panel and the surrounding structure such that the lower track is entirely outside the width of the doorway;

a panel retention system adapted to be carried by one of the door panel and the surrounding structure, wherein the panel retention system is movably connected to the lower track such that the panel retention system and the lower track provide relative traveling motion therebetween to help guide the door panel along the predetermined normal path; and

a resilient connection provided by at least one of the lower track and the panel retention system, wherein the resilient connection limits movement of the door panel out of the predetermined normal path.

32. (New) The door of claim 31, wherein the door panel carries the panel retention system.

33. (New) The door of claim 31, wherein the lower track is attachable to the wall.

34. (New) The door of claim 31, wherein the panel retention system remains in contact with the lower track even if the door panel moves out of the predetermined normal path.

35. (New) The door of claim 31, wherein the panel retention system separates from the lower track if the door panel moves beyond the predetermined normal path.

36. (New) The door of claim 31, wherein the resilient nature of the resilient connection is what limits movement of the door panel out of the predetermined normal path.

37. (New) The door of claim 31, wherein the lower track is a stationary bar.

38. (New) The door of claim 31, wherein the panel retention system comprises a spring and a track follower, wherein the track follower engages the track and the spring is coupled to the track follower to urge the door panel toward the predetermined normal path when the door panel is beyond the predetermined normal path.

39. (New) The door of claim 38, wherein the spring is disposed within a tube.

40. (New) The door of claim 39, wherein the spring is a tension spring.
41. (New) The door of claim 38, further comprising a pliable elongate member coupling the spring to the track follower.
42. (New) The door of claim 41, wherein the pliable elongate member has a length that is adjustable to vary its resiliency.
43. (New) The door of claim 31, wherein the lower track includes the resilient connection.
44. (New) The door of claim 31, wherein the panel retention system includes the resilient connection.
45. (New) A door movable relative a doorway defined by a wall and a floor, wherein the doorway defines a path of pedestrian and vehicle travel through the wall and wherein the door may be subjected to an impact force, the door comprising:
- an upper track;
 - a door panel suspended from the upper track and being movable horizontally across the doorway along a predetermined normal path;
 - a lower track disposed below the upper track, attachable to the wall, and adapted to be disposed above the floor such that no portion of the lower track extends into the path of pedestrian and vehicle travel;

a panel retention system adapted to be carried by the door panel, wherein the panel retention system is movably connected to the lower track such that the panel retention system and the lower track provide relative traveling motion therebetween to help guide the door panel along the predetermined normal path; and

a resilient connection provided by the lower track and the panel retention system, wherein the resilient connection allows the door panel to deviate from the predetermined normal path when the impact force exceeds a predetermined magnitude, and wherein the resilient connection returns the door panel to the predetermined normal path when the impact force no longer exceeds the predetermined magnitude.

46. (New) The door of claim 45, wherein the panel retention system remains in contact with the lower track even if the impact force exceeds the predetermined magnitude and the door panel moves out of the predetermined normal path.

47. (New) The door of claim 45, wherein the panel retention system separates from the lower track if the door panel moves beyond the predetermined normal path.

48. (New) The door of claim 45, wherein the resilient nature of the resilient connection is what returns the door panel to the predetermined normal path.

49. (New) The door of claim 45, wherein the lower track is a stationary bar.

50. (New) The door of claim 45, wherein the panel retention system comprises a spring and a track follower, wherein the track follower engages the track and the spring is coupled to the track follower to urge the door panel toward the predetermined normal path when the door panel is beyond the predetermined normal path.

51. (New) The door of claim 50, wherein the spring is disposed within a tube.

52. (New) The door of claim 51, wherein the spring is a tension spring.

53. (New) The door of claim 50, further comprising a pliable elongate member coupling the spring to the track follower.

54. (New) The door of claim 53, wherein the pliable elongate member has a length that is adjustable to vary its resiliency.

55. (New) The door of claim 45, wherein the lower track includes the resilient connection.

56. (New) The door of claim 45, wherein the panel retention system includes the resilient connection.
